

The manufacturing industry is facing challenges that affect how companies handle their product development. In particular, the greatest impact stems from increasing environmental compliance directives.

With the pressures of meeting regulations such as the Restriction of Hazardous Substances (RoHS) and Waste Electrical and Electronic Equipment (WEEE), many OEMs are turning to software solutions like Omnify Software to help develop products that adhere to the new regulations and ensure the proper product development processes are in place.

The RoHS Directive applies to electrical and electronic products, and their component parts. The WEEE Directive aims to raise the level of reuse and recycling of electrical and electronic equipment (EEE) and encourages designers to create products with reuse and recycling in mind. RoHS supports this by reducing the amount of hazardous chemicals used in production.

Compliance Made Easy

Omnify Software helps companies manage product development under these regulations by allowing easy classification of parts as either compliant or non-compliant, identification of the complete material composition of a part, and the ability to search on this information and export it into a Bill of Material (BOM) report for quick analysis. In addition, Omnify provides a location to store and manage all of the necessary compliance documentation associated to a part (materials declarations/certificates of compliance/IPC-1752 forms).

Omnify equips engineers with compliance information at design time and offers easy report generation at any level of the product design to identify issues early on to help eliminate costly late stage redesign.

The Omnify solution is easy-to-use, fast to implement and affordable so you can begin to develop compliant products quickly. Omnify offers a flexible solution, enabling companies to meet these environmental standards, while maintaining an efficient product development process.

Key Benefits:

- Single, secure location to store and manage all product information
- Helps engineers identify component compliance issues early in the design cycle
- Easily generate compliance reports at any product level
- Gives engineers access to an enhanced data set (costs, status, availability, vendor information)
- Eliminates disconnect between engineering and other groups in an organization
- Ensures enterprise-wide compliant product development processes
- Eliminates costly redesign

Omnify provides a single, secure location to track, store and analyze all of your product data for RoHS compliance.

Classify All Component Data

Offering the ability to assign unlimited attributes to a component, Omnify delivers a solution to easily identify components as either compliant or non-compliant, which can then be searched on and displayed for analysis. Omnify also provides a means of classifying the complete material composition of parts, so you can store data on the amount of hazardous material present in a part along with the total weight. This offers flexibility in meeting evolving environmental regulations.

Generate Compliance Reports

At the component or full product level, you can easily generate a report in Omnify that identifies all of the compliant/non-compliant materials in a product, helping to identify compliance issues at any stage of the product structure. Omnify can also generate reports from on-line content providers.

Manage Documentation

Omnify allows you to securely vault all of the compliance declarations from suppliers, providing a location to store all of the necessary documentation associated to a part. Because the documents are vaulted, viewing and editing of the documents is controlled. Omnify also supports the IPC-1752 specification for Materials Declarations where the PDF forms can be automatically populated with data from within Omnify. All documents can be exported into a bundled report with part data.

Manage Entire Compliance Process In a Single Location

Omnify provides a single, secure location to manage all of your product data. By tracking all compliant part data, documentation, and associated reports in Omnify, you can ensure that everyone involved in the product development process has access to the same product information.
